

ABSTRACT OF THE DISCLOSURE

In a system of manufacturing a semiconductor integrated circuit, a client [[1]], a data-managing center [[3]], a designing center [[4]], and a manufacturing center [[5]] are connected together via the Internet [[2]]. The data-managing center has a cost/number-of-days database [[31]], a reservation status database [[32]], and a design/manufacture status database [[33]]. Each of the centers ~~3, 4, 5~~ uses information contained in the databases ~~31, 32, 33~~ of the data-managing center [[3]], performs two-way communication with the client [[1]], and thereby progresses the production of the semiconductor integrated circuit.
